Exp 4a - Write a Python program for file organization

1. Open a text editor
2. Type the program
3. Save it with .py extension, for eg:- demo.py
4. Open a terminal and run the program using the command, python filename.py, for eg. Python demo.py

Experiment 4b – System calls for file management in python

```
f=open("try.txt", "r");
print(f.read());

f=open("try.txt", "a");
f.write("Now the file has more content");
f.close()

#open and read file after appending
f=open("try.txt", "r");
print(f.read());

f=open("try.txt", "w");
f.write("Woops! I have deleted the content!");
f.close()

#open and read file after overwriting
f=open("try.txt", "r");
print(f.read());
```

Exp 4b -

```
 //Experiment 4 a: - Create a child process using the fork system call.
//Obtain the process ID of both child and parent by using getpid and getppid system call.)
#include <stdio.h>
#include <sys/types.h>
#include <unistd.h>
int main()
{
//fork() make two processes that run the same program.
fork();
printf("Hello world!\n");
printf("Parent Process id=%d", getppid());
printf("Child Process id=%d", getpid());
return 0;
}
```
